

Hysteresis Indices and Beta of IBW sites: Curry, Silverado, and Lake Marguerite

2026-03-26

Aims to plot hysteresis per analyte per storm per site

Metrics

- *Hysteresis index* is calculated as the median (+/- 95% CI) across 2% intervals of discharge.
+HI = clockwise (source limitation or nearstream source)
-HI = counterclockwise (transport limitation or distal source)
- *Beta* is the slope of the CQ relationship on the rising limb of the storm
CIs on beta are bootstrapped 95% CI

NOTES

- Lake Marguerite does not have a lot of chems to work with. Do we know if there are more chems than the 624_runoff_chems.csv from the dropbox?
- Similarly, there is a gap of data in Silverado 2014-2018, was there less sampling in that time or is the data elsewhere?
- individual analyte outliers > 3sd above mean concentration per storm were removed for hysteresis and beta calculations, but remain for individual storm plotting at the bottom of the report

Data munging/cleaning

Workflow before this rmd, in order:

- q_storms.R: import discharge from Lake Margherite, Silverado, & Curry, delineate unique storms, and interpolate Q
- merge_Q_chems.R: merge discharge data with chem data per site, produce brief cq plots per analyte per site
- hysteresis_calc_2.R: calculate hysteresis based on python function, removed a lot of storms with not enough data. also calculates beta

Plotting Hysteresis

Curry – mean HI with confidence intervals per storm per analyte

Silverado – mean HI with confidence intervals per storm per analyte

Lake Marguerite – mean HI with confidence intervals per storm per analyte

Plotting Beta

Curry Beta per storm per analyte

Bars are 95% confidence intervals

Silverado Beta per storm per analyte

Bars are 95% confidence intervals

Lake Marguerite Beta per storm per analyte

Bars are 95% confidence intervals

Curry – HI vs Beta by Analyte

Each dot is an individual storm

Plotting CQ

Precipitation

Storm size = cumulative precipitation (mm) per storm

Curry HI mean vs cumulative precip per storm

Error bars are 95% confidence intervals

Silverado HI mean vs cumulative precip per storm
Error bars are 95% confidence intervals

Lake Margarita HI mean vs cumulative precip per storm
Error bars are 95% confidence intervals

Storm intensity = cumulative precipitation/storm duration

Curry HI mean vs storm intensity
Error bars are 95% confidence intervals

Silverado HI mean vs storm intensity
Error bars are 95% confidence intervals

Lake Margarita HI mean vs storm intensity

Error bars are 95% confidence intervals
